Abstract:

Epithelioid sarcoma is a malignant soft-tissue tumor that mainly located in the extremities. However, the tumor is rarely located in the scalp. We encountered a 58-year-old female patient with right vertex scalp tumor for 3-4 years with growing recently.

The image study consistent with chondroblastoma involving right parietal bone with suspected dura involvement. She received the operation of tumor excision and craniectomy with free ALT flap reconstruction. The Permanent section was an epithelioid sarcoma without free margin. Further chemotherapy and local radiotherapy was arranged after wound healing.
